

# Energy Resources

## Six Energy Resources

The Sun supplies almost all of the energy on Earth — it is transferred to different stores before we use it.

## Renewable and Non-Renewable Resources

We use energy resources for things such as:

generating electricity

heating

transport

<b>NON-RENEWABLE RESOURCES</b>	Energy resources that will run out one day.	 E.g. fossil fuels (take too long to replenish)
<b>RENEWABLE RESOURCES</b>	Energy resources that will <b>never</b> run out.	 E.g. solar energy, wind, waves, plants

One problem with renewable resources is **unreliability** — e.g. it's not always windy or sunny.
